

Algorithms

1. Start
2. Let the user input the blasting diameter, in-hole density, spacing to burden ratio, and bench height.
3. Let the user input the type of rock
4. Use the type of rock to find the powder factor
5. If the rock type is hard: 0.7, medium: 0.45, soft: 0.3, very soft: 0.15
6. Input the formulae needed to find the stemming length, Burden and actual powder factor
7. End

Fragmentation Calculator

1. Start
2. let the user input average in-hole density, bench height, Relative efficient energy of explosive, rock factor and stemming length
3. Input the formula of calculating the mean fragmentation size
4. End
